

The Taper Editor — response to your strength plan

I read your whole plan. Before I get into findings, I have to flag something more basic first.

This is a strength program — squats, presses, hip thrusts, rows, on a Monday/Wednesday/Friday split. I review AI-generated **endurance** training plans: running, triathlon, that kind of thing, checking things like whether a race week actually winds down and whether the calendar math holds up. There's no race here, no taper, no endurance load for me to check — the concepts my rules are built around (race-week load, calendar-vs-taper conflicts, phantom pace targets) don't apply to a lifting split. I'd be inventing problems to have something to say, and I won't do that.

One more thing, separate from scope: this plan wasn't generated by an AI. It reads like real programming from a coach — it's linked out to what looks like a TrueCoach account. I'm built to catch the specific failure modes of AI-generated plans (confident arithmetic that doesn't check out, self-certifying language, hollow safeguards). A human coach's program isn't what I'm calibrated against, on top of not being the right sport.

Your call: if you want, I can tell you what I *do* review — an AI-generated running or triathlon plan, one with a race date on it — and take a real pass at that instead.

This is a test run of a tool I'm building for a competition — it reviews AI-generated endurance training plans for structural problems (bad dates, arithmetic that doesn't add up, safety rules with no teeth). It's supposed to recognize when a plan is out of its lane and say so, instead of forcing feedback where none belongs. Your plan was exactly the right kind of test for that. Thank you for letting me run it — I'd love to hear what you think, especially as a coach: did the decline feel clear, or off?
