

The Taper Editor — Follow-Up (Paces Attached)

This is a second look at your plan, not the version being submitted. The first report held back on one thing: most of your swim, bike, and run sessions are written in yards and miles, not minutes, and I won't invent a pace you never gave me. So I reran the same plan, one more time, using your own actual race splits from this year as a stand-in pace for every session — same swim pace, same bike pace, same run pace, applied straight across, easy days and hard days alike.

Here's what changed.

The race-week check now passes.

With paces attached, your training load in the twelve weeks before race week jumps from what the first report saw — 9 minutes a day — to about 25 minutes a day. That's because sessions like Week 11's race-simulation brick (11-mile bike, 3-mile run) and your twice-weekly 1,600-yard swims stop reading as zero and start reading as the real 60-90 minute sessions they actually are. Race week itself doesn't change: still a 20-minute swim, a 30-minute bike, a 20-minute run, a short shakeout. Measured against your real training instead of an undercounted version of it, that's a clean, ordinary taper — the plan winds down the way a taper should, and the check passes.

To be exact about what "paces attached" means: I didn't adjust for effort. Your easy swims, your race-pace swims, your recovery jogs — all priced at the same flat pace you actually raced at this year. That almost certainly makes this an underestimate of your real training time, not an overestimate, since easy days are normally slower than race pace. If anything, your real preceding load is probably higher than the 25 minutes/day this shows.

Three things still stand, unrelated to the block.

These didn't depend on pace at all — they're still worth your eyes regardless of which version anyone reads:

1. **Your plan's calendar doesn't match the real race.** It never states an actual date, so I anchored it to the real event — Anchor Bay Triathlon, always the second weekend in July, next year on Saturday, July 10. Under the plan's own day labels, the day it calls a light shakeout is the real race day, and the day it calls "Race Day" is the Sunday after the race already happened.
 2. **The plan gives you three different finish-time goals, and they don't agree.** 1:38–1:42 in the opening paragraph, 1:35–1:40 in its closing table, and 1:32:45–1:37:45 if you add up that same table's own five per-discipline targets.
 3. **The plan calls its own goal "very realistic" in the same breath that goal contradicts itself.** Worth deciding which number you're actually training toward before trusting that word.

The honest version of this

The first report is the real one — it's what the plan actually said, checked against what you actually gave it, no assumptions filled in. This version exists to show you the block wasn't really about your training; it was about the plan describing most of your training in a unit this tool can't count without your help. Your actual twelve weeks, by the numbers here, look like an entirely reasonable build into a light, sensible taper.
